

METHOD AND APPARATUS FOR TREATMENT OF BAGGED ORGANIC MATERIALS**ABSTRACT OF THE DISCLOSURE**

5 A method and apparatus for treating bagged materials. A
bagging machine is equipped with feed tubes that feed a conduit
through a bag filling tunnel of the machine and through the open
end of the bag and into the bag. The conduit is perforated and
when the bag is filled, the length of the conduits is extended out
10 through the bag end to be connected to a treatment media, e.g.,
forced air. An opening is provided at the rear end to provide an
exhaust opening for air that is forced into the conduit, out the
perforations and through the bagged material. The air will dry the
material to lower the moisture content or provide oxygen as may be
15 desired to enhance decomposition. Water may also be introduced as
desired.
